How to screen memecoins for DLMM the LogicalTA way.

With thousands of memecoins appearing everyday, how do we screen them to filter out the bad ones and only pick the good coins to DLMM with?

This will be a detailed post about how I do my filtering which I mentioned before briefly in LP Army Discord.

Gonna be a long post, so bookmark for future reference.

🧵 1/13

DLMN me!
DLMN me!
DLMN me!
DLMN me!
DLMN me!
Grok

1. Use rugcheck.xyz

For every coin that interests me, I would copy and paste the CA into rugcheck and check for any red flags. Let's dive into a few examples about what to look out for.

An obvious example of a coin to avoid. Too many red flags from the beginning, I would just ignore this coin. I would not even look at the data when I see this. Top holder has too many coins, he can dump the price to zero if he wants.

There are cases where the dev move the coins to other wallets so the risk analysis score goes down, but the red flags are already there. Just go on to the next coin for me.

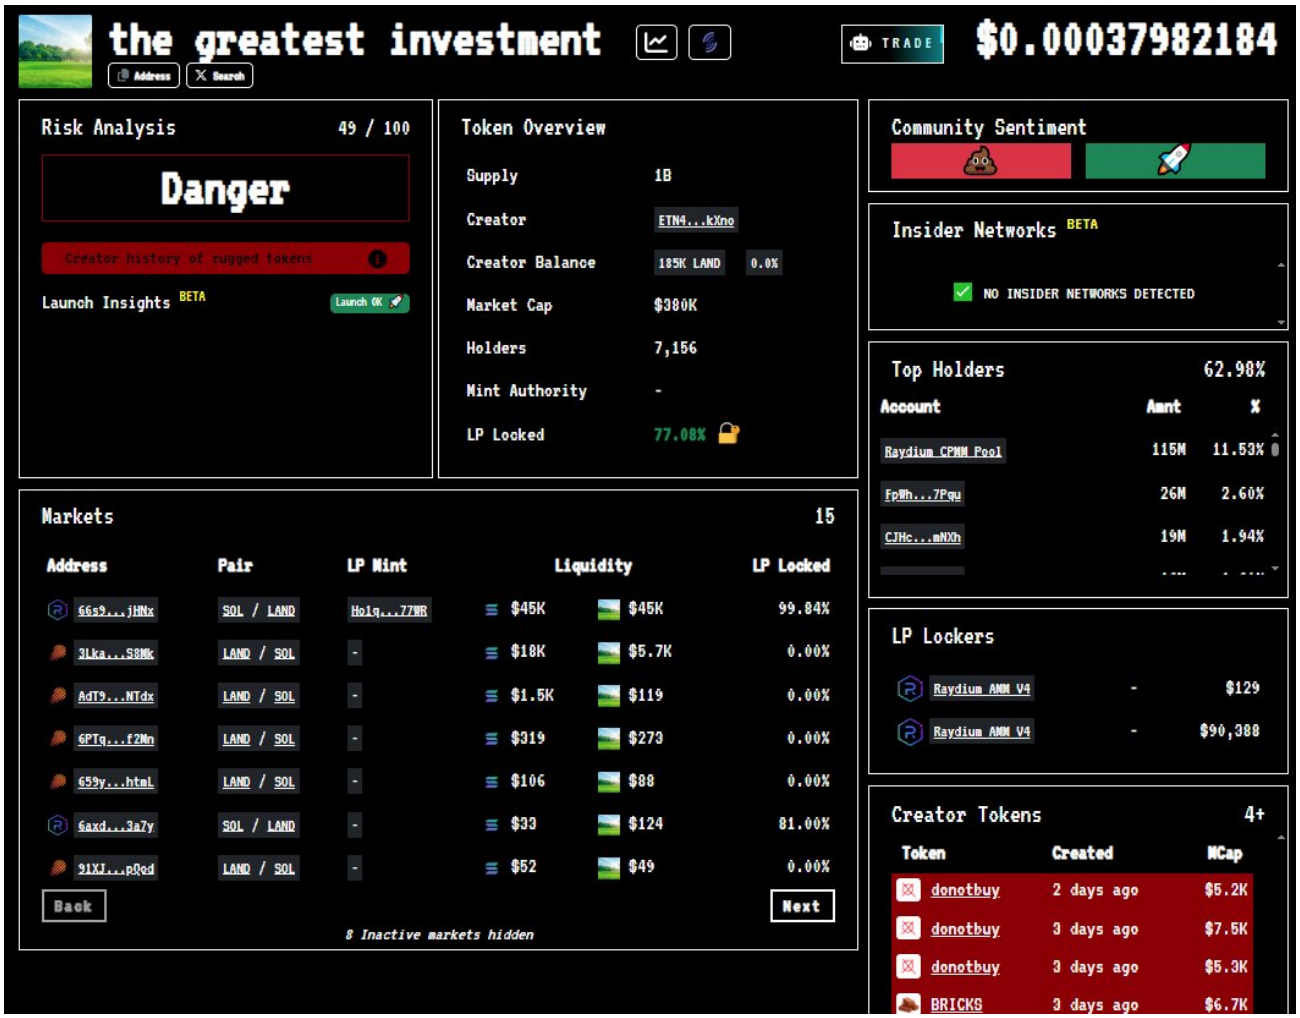
2/13

One of the more common risks we would see is a creator that has a history of rugging coins. For such coins I will still let it pass and look at the holders data on GMGN. Because in my mind these devs also want to launch a successful coin and not every coin will be successful. So dumping coins that did not make it to start a new one is probably not a big red flag.

Such coins can still be used for DLMM but be ready to get out early as usually when the coin reaches a certain Market Cap like 1m, the dev suddenly rugs the coin. If you want to be safe, just avoid such coins.

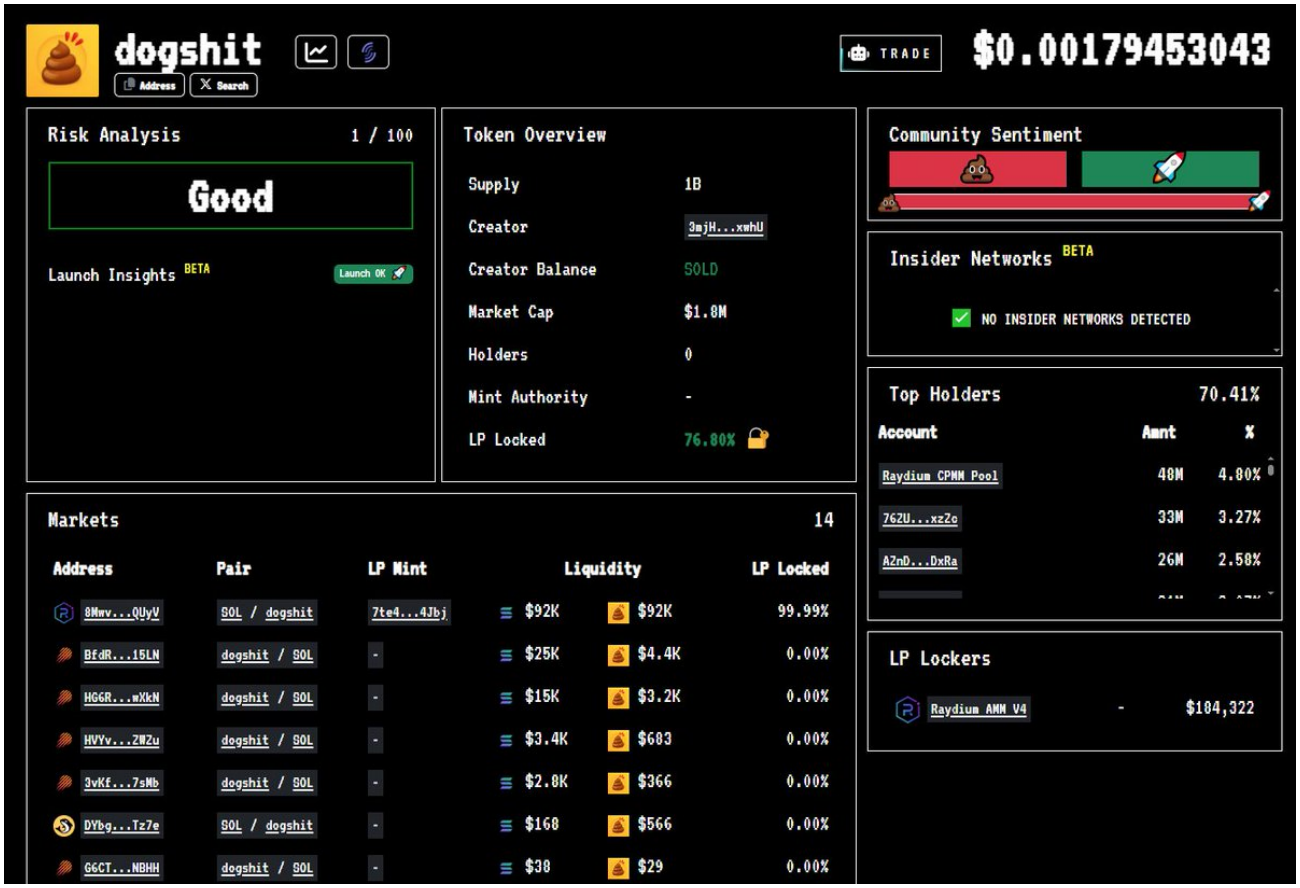
On to the coins that pass the rugcheck.

3/13



A coin that passes rugcheck is where there are no red flags and Risk Analysis is 1/100. But wait , it does not mean we would DLMM this coin right away, we have to still look at the underlying data on GMGN. Because ruggers have figured out that we use rugcheck and they also use some applications to have a good launch risk score but still rug in the end.

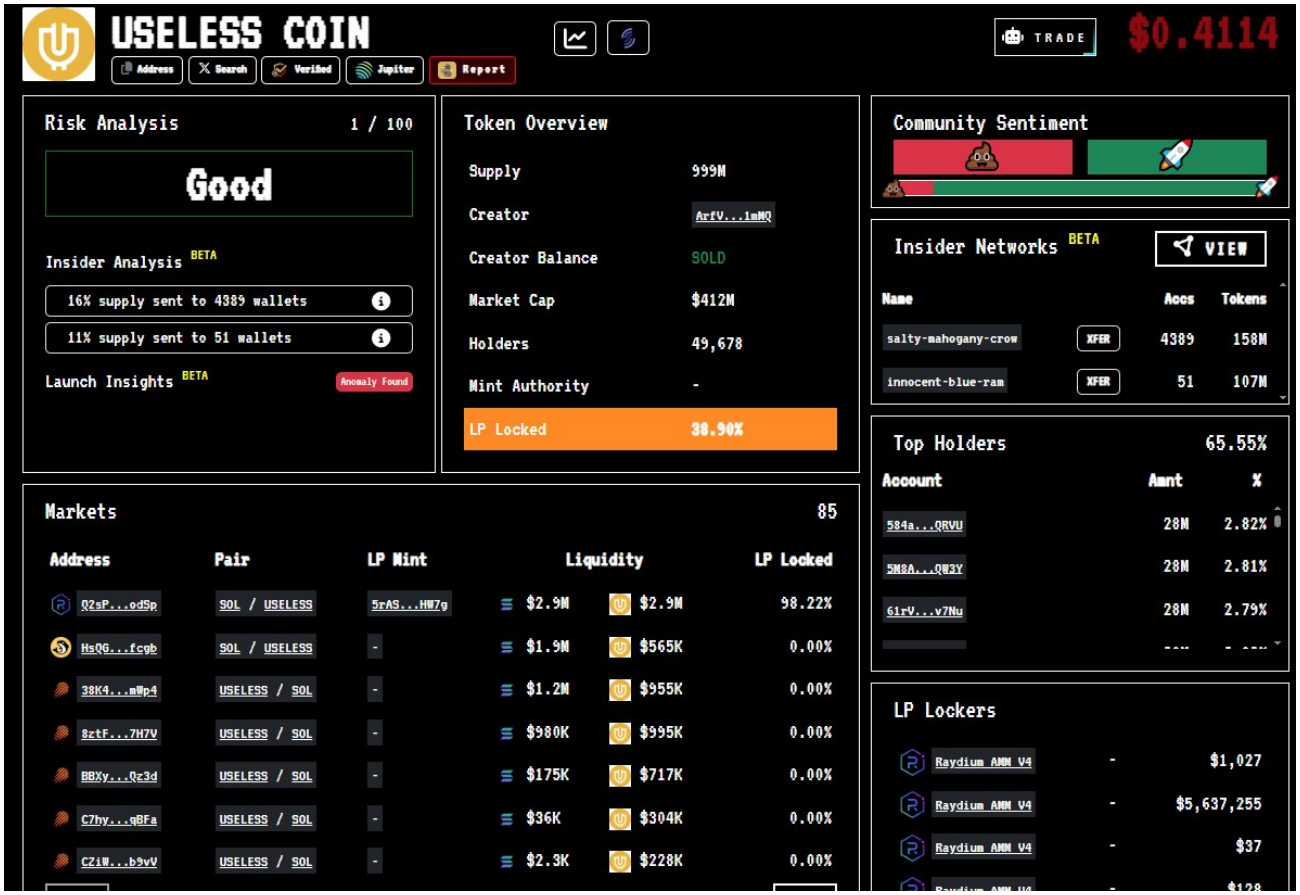
4/13



The last type is most commonly seen coin on rugcheck is where the risk analysis is good at 1/100 but there are anomalies. These anomalies are usually insiders buying the coin before migration and sending to many wallets. They dont generally mean the coin will rug as we can see that Useless coin did very well. But we still have to look at the underlying data on GMGN to be safe. But we just have to keep in mind about it if we decide to DLMM the coin.

On to GMGN data analysis.

5/13



For every coin that I look at everyday, I log the data into Excel and use that as a reference for what data do we need to see to DLMM a good coin.

Then from the data I would highlight the parts where there are red flags and usually will just avoid doing DLMM on them.

Next I will explain what each data is from and what the numbers mean to me.

But first the obvious one, back in post 5/13 the example was a coin with anomalies and generally this is what I would be expecting to see on GMGN. Red flags on the top wallets as they are all funded from the same wallet. Such coins are 100% avoid for me, I would not even look if anyone is creating pools for this coin.

Next onto the data.

These are data that I look at.

1. Top holder % - does not matter if it is Raydium or a wallet. The number is what I want to see. Logically for a new coin, you dont expect to see under 5% even for Raydium, that is a red flag as it usually means a lot of people bought very early and are waiting to dump. And of course top holder higher than Raydium % is also a red flag for new coins.

2. Number of Holders - For a new coin, usually we will see 500-3000 holders, any number below or above warrants a red flag and should be avoided or look at other data first before DLMM.

3. MC/holder - the higher the number the more risky the coin is as the top holders might take profits and dump the chart.

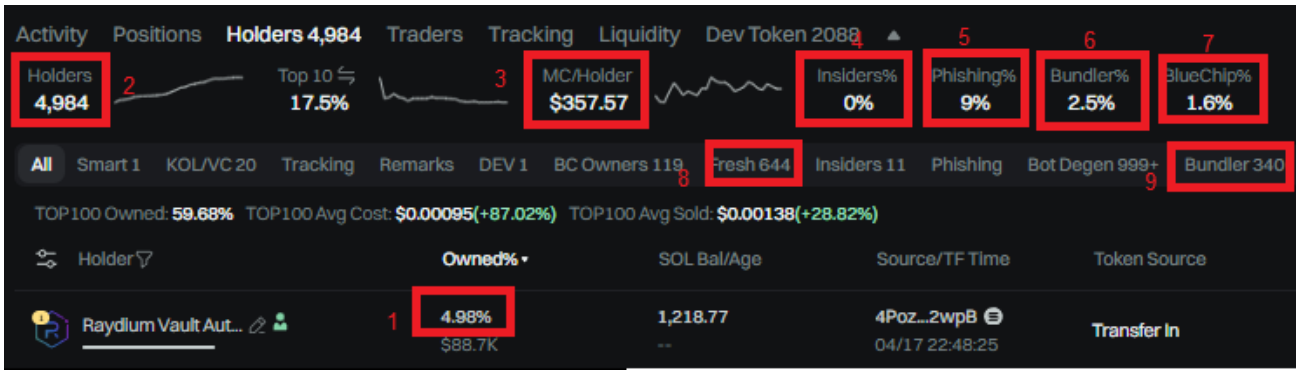
4. Insiders % - Anything more than 5% is a red flag.
5. Phishing % - More than 30% is a red flag
6. Bundler % - More than 30% is a red flag
7. Bluechip % - Less than 0.5% is a red flag for me as there is usually some problems with the holder wallets that Bluechip holders does not want to hold.

8. Number of Fresh wallets - Less than 100 is a warning, number tend to increase over time.
9. Number of Bundled wallets - Less than 100 is a warning, number tend to increase over time.
10. Number of Fresh wallets(8) divide by holders(2) - Above 40% is a red flag.
11. Number of Bundled wallets(9) divide by holders(2) - Above 40% is a red flag.
12. Type of red flag from rugcheck if there is any.

Then again just because the coin has red flags does not mean we cannot earn using DLMM. It just means to be careful with the strategy we should use. Usually if I have to DLMM a coin with some red flags I would go with a bigger pool than normal.

Now let's look at some examples combining rugcheck and GMGN.

8/13

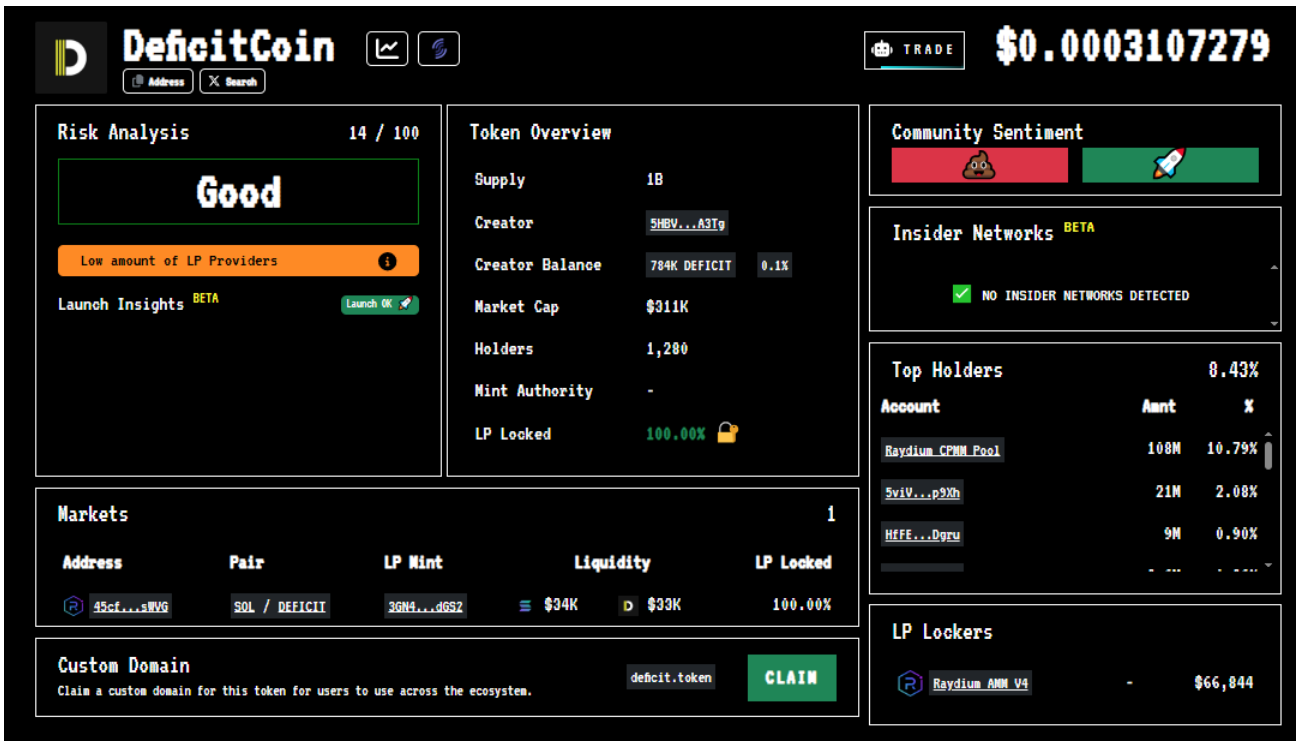


Example 1 - Deficit coin on rugcheck

Rugcheck tells us it has a risk analysis of 14/100 and the anomaly is Low amount of LP providers. Low LP providers can mean two things for me.

One is the coin is still new and people have not found it so if you found it you are early. Second is there is a problem with the coin that noone wants to provide LP, usually GMGN will tell us more.

9/13



Deficit coin on GMGN

The data on GMGN is clean at first glance, but using the data I pointed out somethings become clear.

1. Bluechip holders only at 0.2%, which is less than the 0.5% I deem safe.
2. Number of Fresh wallets and Bundled wallets are under 100, this to me tends to mean that the dev is hiding data and it is a warning.
3. The top holders are too "clean", usually I would expect to see some other icons like phising, axiom, whales, bundled. But this is too clean and bluechips are avoiding which is a red flag.

So in conclusion I would avoid to do DLMM on this coin. Let's see what the coin did next.

Deficit coin chart.

We can say that we dodged a bullet here, even though it was not a straight dump, but the way it rugs would probably not let us earn enough fees to cover the Impermanent Loss we would suffer.

Next we look at a good coin to DLMM for me.

11/13

Dogshit coin - contrary to the name, this coin passes all my filters, clean on rugcheck, clean on GMGN. Hence the chart gives us many opportunities to DLMM until the volume slows down at the top. Remember when we DLMM new coins, we don't stay in for too long as 99% of meme coins will rug in the end.

This is just my method of screening meme coins to DLMM. It is not a perfect method, but most importantly for me is to screen out the rugs so that my portfolio can grow in time. Sure I will miss to DLMM some good coins with volume with this screener. But it also screens out the rugs that would make me lose all those gains in the first place.

Do I still get rugged with this screener? Yes I still get rugged sometimes as we can't avoid FOMO and itchy hands. As this method screens out a lot of coins, there will be people having itchy hands and looking to DLMM any coins with volume.

Not to mention other people posting wins in coins with red flags makes me wonder if I am too strict with my filters. Again a red flag does not mean we cannot earn fees from DLMM on the coin, it just tells us to be more careful and perhaps get out early once the fees have been printed.

So hope people find this post useful and can help to avoid getting rugged too much in the future.
