This is why I developed the Evil Panda Strat the way it is. This is the final exam to graduate from Evil Panda Strat. Everyone that got into this coin probably lost a lot but not if you execute the Evil Panda Strat correctly.

First when you see a coin pumping and pumping, be very careful, the bigger the pump, the bigger the dump as those in profits wants to dump their bags.

So when I felt like the top is close I opened a SOL sided position in a 125/10% pool with a wide -95% range (purple box). Notice how I did not chase the price up and keep repositioning, I just left my position there as I know when it starts dumping it will very quickly come into my range. So sometimes it is ok to not chase the pumps, not opening from ATH is a good thing when you are expecting a dump.

This is why I keep saying to use 5% or 10% pools with wide -90% to -95% ranges, it is Insurance for such scenarios for predictable unpredictability. When everyone is dumping, you welcome it as they are all paying 10% fees using your pool. All the bundlers, people that panicked, people that use SL, people that cannot handle the pressure all sold into my pool.

The Evil Panda Strat is to make us the last pool still hodling strong when everyone else ran away, to be the final exit liquidity provider. We provide that liquidity for everyone to exit into with juicy 5% or 10% fees. This is the prime essence of the Evil Panda Strat.

Then when we earned fees from all the dumps, we just wait for an exit signal like always. A RSI(2) close above 90 and Price closing above BB Upper line on the 5mins chart.

If you can make such a play correctly, you have truly mastered the Evil Panda Strat fully. Juicy fees and profits, where else can you earn money from -97% dumps other than on Meteora.

@LP Army @Meteora @MeteoraIDN
